Angelman syndrome (AS) affects approx. 1 in 15,000.

Individuals with AS typically have balance issues, motor impairment, debilitating seizures and developmental delay.

Some do not walk, most do not speak.

The science tells us we can #CureAngelman. Various clinical trials are underway, FAST has funded 5 potential therapeutics and invested \$20 million in research and we aren't finished yet!

For more information, visit-Foundation for
Angelman Syndrome Therapeutics at:
