

February 15th is International Angelman Day

What is Angelman Syndrome?

Angelman syndrome (AS) is a rare neurogenetic disorder that affects approximately one in 15,000 people or approximately 500,000 individuals worldwide. Children and adults with AS typically do not speak verbally. They have balance issues, gross and fine motor impairments and often debilitating seizures. Some individuals never walk. Disrupted sleep cycles also can be a serious challenge to the individual and caretaker(s).
